# NSW SCIENTIFIC COMMITTEE

## Final Determination

The Scientific Committee, established by the Threatened Species Conservation Act, has made a Final Determination to list Grey Box - Grey Gum Wet Sclerophyll Forest in the NSW North Coast Bioregion as an ENDANGERED ECOLOGICAL COMMUNITY in Part 3 of Schedule 1 of the Act. Listing of Endangered Ecological Communities is provided for by Part 2 of the Act.

The Scientific Committee has found that:

1. Grey Box - Grey Gum Wet Sclerophyll Forest in the NSW North Coast Bioregion is the name given to the ecological community characterised by the species listed in paragraph 2, and which at maturity typically has a tall open canopy of eucalypts with a structurally complex understorey including rainforest trees and shrubs, vines, ferns and herbs. Structural characteristics of the community may vary, depending on the intensity and nature of past disturbances including fire, logging and partial clearing.
2. Grey Box - Grey Gum Wet Sclerophyll Forest is characterised by the following assemblage of species:

<i>Abutilon oxycarpum</i>	<i>Acacia irrorata</i>
<i>Acacia maidenii</i>	<i>Acronychia oblongifolia</i>
<i>Alchornea ilicifolia</i>	<i>Alectryon subcinereus</i>
<i>Alectryon tomentosus</i>	<i>Alphitonia excelsa</i>
<i>Alyxia ruscifolia</i>	<i>Araucaria cunninghamii</i>
<i>Arytera divaricata</i>	<i>Breynia oblongifolia</i>
<i>Bridelia exaltata</i>	<i>Celastrus subspicatus</i>
<i>Cissus antarctica</i>	<i>Cordyline petiolaris</i>
<i>Croton insularis</i>	<i>Croton verreauxii</i>
<i>Cupaniopsis parvifolia</i>	<i>Cyperus gracilis</i>
<i>Derris involuta</i>	<i>Dianella caerulea</i>
<i>Diospyros australis</i>	<i>Diospyros pentamera</i>
<i>Doodia aspera</i>	<i>Drypetes deplanchei</i>
<i>Elaeodendron australe</i>	<i>Eucalyptus biturbinata</i>
<i>Eucalyptus moluccana</i>	<i>Eucalyptus propinqua</i>
<i>Eucalyptus siderophloia</i>	<i>Euroschinus falcatus</i>
<i>Gahnia aspera</i>	<i>Geijera latifolia</i>
<i>Geitonoplesium cymosum</i>	<i>Gossia bidwillii</i>
<i>Guioa semiglauca</i>	<i>Hibiscus heterophyllus</i>
<i>Imperata cylindrica</i>	<i>Jagera pseudorhus</i>
<i>Jasminum volubile</i>	<i>Lepidosperma laterale</i>
<i>Lomandra longifolia</i>	<i>Lophostemon confertus</i>
<i>Maclura cochinchinensis</i>	<i>Mallotus philippensis</i>
<i>Maytenus bilocularis</i>	<i>Melaleuca salicina</i>
<i>Myrsine variabilis</i>	<i>Notelaea longifolia</i>
<i>Ottochloa gracillima</i>	<i>Pandorea pandorana</i>
<i>Pellaea falcata</i>	<i>Pittosporum multiflorum</i>
<i>Pittosporum revolutum</i>	<i>Polyscias elegans</i>
<i>Psychotria daphnoides</i>	<i>Psydrax odorata</i> subsp. <i>buxifolia</i>
<i>Pyrrosia rupestris</i>	<i>Rauwenhoffia leichhardtii</i>
<i>Smilax australis</i>	<i>Solanum stelligerum</i>
<i>Tetrastigma nitens</i>	

3. The total species list of the community is considerably larger than that given above, with many species present in only one or two sites or in low abundance. The species composition of a site will be influenced by the size of the site, recent rainfall or drought condition and by its disturbance (including fire) history. The number of species, and the above ground relative abundance of species will change with time since fire, and may also change in response to changes in fire regime (including changes in fire frequency). At any one time, above ground individuals of some species may be absent, but the species may be represented below ground in the soil seed banks or as dormant structures such as bulbs, corms, rhizomes, rootstocks or lignotubers. The list of species given above is of vascular plant species; the community also includes micro-organisms, fungi, cryptogamic plants and a diverse fauna, both vertebrate and invertebrate. These components of the community are poorly documented.
4. Grey Box - Grey Gum Wet Sclerophyll Forest is typically dominated by an open tree canopy of *Eucalyptus moluccana* (Grey Box) and *Eucalyptus propinqua* (Grey Gum) and, less commonly, *Eucalyptus biturbinata* (Grey Gum), *Eucalyptus siderophloia* (Grey Ironbark) and *Araucaria cunninghamii* (Hoop Pine). Some botanists apply the name *Eucalyptus punctata* in a broad sense to include *E. biturbinata*. The understorey typically includes a diverse and prominent stratum of rainforest trees and shrubs including *Maytenus bilocularis* (Orangebark), *Guioa semiglauca* (Guioa), *Mallotus philippensis* (Red Kamala), *Psychotria daphnoides* (Smooth Psychotria), *Notelaea longifolia* (Large Mock-olive) and *Polyscias elegans* (Celery Wood). Vines, including *Cissus antarctica* (Water Vine), *Derris involuta* (Native Derris), *Smilax australis* (Austral Sarsaparilla), *Celastrus subspicatus* (Large-leaved Staff Vine), *Pandorea pandorana* (Wonga Vine) and *Geitonoplesium cymosum* (Scrambling Lily) commonly grow over and amongst the understorey shrubs and trees. The groundcover comprises graminoid herbs, including *Cyperus gracilis* (Slender Flat-sedge), *Gahnia aspera* (Red-fruited Saw Sedge), *Ottochloa gracillima* (Ottochloa) and *Lomandra longifolia* (Spiny-headed Matrush), and ferns, including *Doodia aspera* (Rasp Fern). Mature stands of the community are typically tall open-forest or open-forest with a structurally complex, multi-stratum understorey, while regrowth stands or recently disturbed stands may take on the structure of low closed forest or scrub, or may have simplified understorey structure, depending on the nature of the disturbance and the time elapsed since.
5. A number of threatened species occur within, or may use habitat resources associated with Grey Box - Grey Gum Wet Sclerophyll Forest. These include the following:

6. Grey Box - Grey Gum Wet Sclerophyll Forest typically occurs on the escarpment slopes and foothills of north-eastern NSW, most commonly between 200 and 500 m elevation, where mean annual rainfall exceeds approximately 1000 mm and has a summer maximum (DECC 2008). Soils that support the community are relatively fertile and derived from a range of igneous (including acid volcanic, basic volcanic and intrusive igneous) or fine-grained sedimentary rocks.
7. Grey Box - Grey Gum Wet Sclerophyll Forest is currently known from the local government areas of Kyogle and Tenterfield, but may occur elsewhere within the NSW North Coast bioregion (*sensu* Thackway and Cresswell 1995).
8. Grey Box - Grey Gum Wet Sclerophyll Forest includes 'Grey Box - Northern Grey Gum' (Forest Type 81) of Baur (1989) and 'Grey Box - Northern Grey Gum' (Forest Ecosystem 62) of NPWS (1999). It belongs to the North Coast Wet Sclerophyll Forests vegetation class of Keith (2004).
9. All known records of Grey Box - Grey Gum Wet Sclerophyll Forest occur within three locations in north-eastern NSW: the vicinity of Bald Knob State Forest to the west and north-west of Woodenbong; Unungar State Forest and Mt Lindesay State Forest (east of Woodenbong); and the Mallanganee district to the south-east of Bonalbo. Mapping by NPWS (1999) indicates that the community is scattered amongst these locations in patches totalling approximately 510 ha. Based on a grid scale of 4 km<sup>2</sup> (IUCN 2008), its area of occupancy is estimated to be 68 km<sup>2</sup>. All records of the community fall within a total extent of occurrence estimated to be approximately 500 km<sup>2</sup>. All of these estimates indicate that the community has a highly restricted distribution.
10. Since European settlement, and relative to the longevity of its dominant trees, which live for several hundred years, Grey Box - Grey Gum Wet Sclerophyll Forest has undergone a large reduction in geographic distribution. NPWS (1999) estimated that approximately 69% of its former extent has been cleared. This large reduction is evident from relic trees of characteristic species that remain in otherwise cleared landscapes within the community's extent of occurrence (DECC 2008). Grey Box - Grey Gum Wet Sclerophyll Forest continues to be threatened by small-scale clearing, particularly where it occurs on fertile soils that are suitable for agriculture. 'Clearing of native vegetation' is listed as a Key Threatening Process under the *Threatened Species Conservation Act 1995*.
11. Grey Box - Grey Gum Wet Sclerophyll Forest has undergone changes in structure, including loss of hollow-bearing trees, as a consequence of timber harvesting. Much of the community is currently in a state of regrowth after past logging activity. DECC (2008) estimates that over half

of the remaining areas exhibit moderately high to very high levels of disturbance. The upper stratum is nearly always dominated by regrowth trees with very few mature or senescent trees remaining in the areas surveyed. Most of the remaining stands are within State Forests that may be prone to future logging operations. The loss of hollow-bearing trees, which provide important fauna habitat, and other structural changes associated with timber harvesting and partial clearing activities are indicative of a large reduction in ecological function of the community. 'Loss of hollow-bearing trees' is listed as a Key Threatening Process under the *Threatened Species Conservation Act 1995*.

12. Grey Box - Grey Gum Wet Sclerophyll Forest is also potentially threatened by grazing and inappropriate fire regimes. Cattle grazing is practiced in large areas of freehold and leasehold eucalypt forest in north-east NSW, including Grey Box - Grey Gum Wet Sclerophyll Forest. Frequent burning of the understorey is carried out as part of forest management for both cattle production and timber production. There is evidence that such burning and grazing practices result in a large reduction in ecological function associated with changes in the structure, diversity and composition of a range of eucalypt forest communities in northern NSW (York 1999, 2000; Andrew *et al.* 2000; Henderson and Keith 2002; Harris *et al.* 2003; York and Tarnawski 2004; Tasker and Bradstock 2006). 'High frequency fire resulting in disruption of life cycle processes in plants and animals and loss of vegetation structure and composition' is listed as a Key Threatening Process under the *Threatened Species Conservation Act 1995*.
13. Clearing activity, grazing, frequent burning and other disturbances accelerate the invasion of weeds into Grey Box - Grey Gum Wet Sclerophyll Forest. The most significant of these is *Lantana camara* (Lantana) which was recorded in 19 of 20 documented vegetation sites of Grey Box - Grey Gum Wet Sclerophyll Forest (DECC 2008). Lantana dominated the mid stratum at many of these sites. Infestations of this species have been identified as one of several factors implicated in widespread forest eucalypt dieback in eastern NSW (Wardell-Johnson *et al.* 2006). The invasion and establishment of exotic species in Grey Box - Grey Gum Wet Sclerophyll Forest results in a large reduction in the ecological function of the community. 'Invasion, establishment and spread of Lantana (*Lantana camara* L. *sens. lat.*)' is listed as a Key Threatening Process under the *Threatened Species Conservation Act 1995*.
14. Grey Box - Grey Gum Wet Sclerophyll Forest in the NSW North Coast Bioregion is not eligible to be listed as a critically endangered ecological community.
15. Grey Box - Grey Gum Wet Sclerophyll Forest in the NSW North Coast Bioregion is eligible to be listed as an Endangered Ecological Community as, in the opinion of the Scientific Committee, it is facing a very high risk of extinction in New South Wales in the near future, as determined in accordance with the following criteria as prescribed by the *Threatened Species Conservation Regulation 2002*:

**Clause 25**

The ecological community has undergone, is observed, estimated, inferred or reasonably suspected to have undergone or is likely to undergo within a time span appropriate to the life cycle and habitat characteristics of its component species:

- (b) a large reduction in geographic distribution.

**Clause 26**

The ecological community's geographic distribution is estimated or inferred to be:

- (b) highly restricted,

and the nature of its distribution makes it likely that the action of a threatening process could cause it to decline or degrade in extent or ecological function over a time span appropriate to the life cycle and habitat characteristics of the ecological community's component species.

**Clause 27**

The ecological community has undergone, is observed, estimated, inferred or reasonably suspected to have undergone or is likely to undergo within a time span appropriate to the life cycle and habitat characteristics of its component species:

- (b) a large reduction in ecological function, as indicated by any of the following:
  - (d) change in community structure
  - (g) invasion and establishment of exotic species
  - (h) degradation of habitat

## NSW SCIENTIFIC COMMITTEE

### Final Determination

The Scientific Committee, established by the Threatened Species Conservation Act, has made a Final Determination to list the Hunter Valley Vine Thicket in the NSW North Coast and Sydney Basin Bioregions, as an ENDANGERED ECOLOGICAL COMMUNITY in Part 3 of Schedule 1 of the Act. Listing of Endangered Ecological Communities is provided for by Part 2 of the Act.

The Scientific Committee has found that:

1. Hunter Valley Vine Thicket in the NSW North Coast and Sydney Basin Bioregions is the name given to the ecological community mainly occurring on Carboniferous sediments on rocky slopes and characterised by the assemblage of species in paragraph 2. The community typically forms a low closed forest dominated by trees with shrubs and vines. All sites are within the NSW North Coast and Sydney Basin Bioregions. Those sites within the NSW North Coast Bioregion are in the southern part of the bioregion.
2. Hunter Valley Vine Thicket in the NSW North Coast and Sydney Basin Bioregions is characterised by the following assemblage of species:

<i>Acacia implexa</i>	<i>Eucalyptus albens</i>
<i>Alectryon oleifolius</i> subsp. <i>elongatus</i>	<i>Galium propinquum</i>
<i>Alectryon subcinereus</i>	<i>Geijera parviflora</i>
<i>Austrodanthonia fulva</i>	<i>Macrozamia concinna</i>
<i>Austrostipa verticillata</i>	<i>Marsdenia flavescens</i>
<i>Beyeria viscosa</i>	<i>Melia azedarach</i> var. <i>australasica</i>
<i>Brachychiton populneus</i> subsp. <i>populneus</i>	<i>Notelaea microcarpa</i> var. <i>microcarpa</i>
<i>Breynia oblongifolia</i>	<i>Olearia elliptica</i> subsp. <i>elliptica</i>
<i>Callitris glaucophylla</i>	<i>Pandorea pandorana</i> subsp. <i>pandorana</i>
<i>Canthium odoratum</i>	<i>Parsonsia eucalyptophylla</i>
<i>Cheilanthes sieberi</i>	<i>Parsonsia lanceolata</i>
<i>Cissus opaca</i>	<i>Pellaea falcata</i>
<i>Clematis glycinoides</i>	<i>Rapanea variabilis</i>
<i>Clerodendrum tomentosum</i>	<i>Rhagodia parabolica</i>
<i>Cynodon dactylon</i>	<i>Solanum brownii</i>
<i>Dichondra repens</i>	<i>Spartothamnella juncea</i>
<i>Einadia hastata</i>	<i>Stellaria flaccida</i>
<i>Elaeodendron australe</i> var. <i>australe</i>	<i>Tylophora grandiflora</i>
<i>Elaeodendron australe</i> var. <i>elongatus</i>	<i>Urtica incisa</i>

3. The total species list of the community is considerably larger than that given above, with many species present in only one or two sites or in low abundance. The species composition of a site will be influenced by the size of the site, recent rainfall or drought condition and by its disturbance (including fire) history. The number of species, and the above ground relative abundance of species will change with time since fire, and may also change in response to changes in fire regime (including changes in fire frequency). At any one time, above ground individuals of some species may be absent, but the species may be represented below ground in the soil seed banks or as dormant structures such as bulbs, corms, rhizomes, rootstocks or lignotubers. The list of species given above is of vascular plant species, the community also includes micro-organisms, fungi, cryptogamic plants and a diverse fauna, both vertebrate and invertebrate. These components of the community are poorly documented.

4. Hunter Valley Vine Thicket typically forms a low forest, usually less than 10 m tall, with a closed canopy dominated by trees, with shrubs and vines. The canopy may include the two varieties of *Elaeodendron australe* (Red Olive Plum), *Geijera parviflora* (Wilga), *Notelaea microcarpa* var. *microcarpa* (Native Olive) and *Alectryon oleifolius* subsp. *elongatus* (Western Rosewood). Emergent eucalypts are common and include *Eucalyptus albens* (White Box), *E. dawsonii* (Slaty Box) and *E. crebra* (Narrow-leaved Ironbark). A shrub stratum is usually present and includes *Olearia elliptica* subsp. *elliptica* (Sticky Daisy Bush) and *Rhagodia parabolica* (Mealy Saltbush). Vines dominate the canopy and include *Cissus opaca* (Small-leaved Water Vine), *Marsdenia flavescens* (Hairy Milk Vine), *Parsonsia eucalyptophylla* (Gargaloo) and *Pandorea pandorana* subsp. *pandorana* (Wonga Vine). Ground cover is generally sparse and includes *Urtica incisa* (Stinging Nettle) and *Austrostipa verticillata* (Slender Bamboo Grass).
5. Hunter Valley Vine Thicket mainly occurs on rocky slopes on Carboniferous strata often on limestone. Hunter Valley Vine Thicket has been described by Peake (2006) and Curran (2006) and Curran *et al.* (2008). It falls broadly within the rainforest classification *Alliance VIII, Sub-Alliance 32 Notelaea microcarpa-Ehretia membranifolia-Geijera parviflora* of Floyd (1990). It shares some characteristics with, but is not part of two Endangered Ecological Communities listed under the *Threatened Species Conservation Act 1995*: *Cadellia pentastylis* (Ooline) community in the Nandewar and Brigalow Belt South Bioregions, and Semi-evergreen Vine Thicket in the Brigalow Belt South and Nandewar Bioregions.
6. Hunter Valley Vine Thicket has been recorded from the local government areas of Muswellbrook, Singleton, and Upper Hunter but may occur elsewhere within the Sydney Basin Bioregion and NSW North Coast Bioregion (*sensu* Thackway and Creswell 1995).
7. Hunter Valley Vine Thicket has a highly restricted geographic distribution. Its area of occupancy is estimated to be approximately 52 km<sup>2</sup> based on 2 x 2 km grids, the scale recommended for assessment of species distributions by IUCN (2008). Within these grids, the community occurs mostly as patches less than 10 ha in extent and a few somewhat larger patches exceeding 100 ha, which are estimated to represent approximately 85% of the pre-European distribution of the community (Peake 2006). The only stand known to occur in a conservation reserve is at Mt Dangar within the Goulburn River National Park.
8. Some stands of Hunter Valley Vine Thicket contain an endangered population of *Cymbidium canaliculatum*, and the endangered species *Senecio linearifolius* var. *dangarensis*, both listed under the *Threatened Species Conservation Act 1995*.
9. Threats to Hunter Valley Vine Thicket include clearing and track building, frequent fire, trampling and grazing by cattle, and weed invasion. The community is threatened by stochastic events due to its fragmented distribution and the small size of remnant patches. These threats are escalating and are intensified by the absence of a buffer around forest margins (Turner and Vernon 1994). The largest area of Hunter Valley Vine Thicket at Brushy Hill has been fragmented by construction and maintenance of a track and a pipeline. This has also allowed the incursion of livestock and the invasion of exotic species. Invasion by the exotic thicket-forming shrub Lantana (*Lantana camara*) has been demonstrated to increase following disturbances associated with fire or grazing (Gentle and Duggin 1997a). Lantana (*Lantana camara*) occurs in and around many stands and poses a threat through structural alteration, invasion and allelopathic suppression of rainforest seedlings (Gentle and Duggin 1997b). African Olive (*Olea europea* subsp. *cuspidata*) also poses a significant threat through invasion (Peake 2006). 'Clearing of native vegetation', 'Invasion and establishment of exotic vines and scramblers', and 'Invasion, establishment and spread of Lantana (*Lantana camara* L. *sens. lat.*)' are listed as Key Threatening Processes under the *Threatened Species Conservation Act 1995*.

10. Hunter Valley Vine Thicket in the NSW North Coast and Sydney Basin Bioregions is not eligible to be listed as a critically endangered ecological community.
11. Hunter Valley Vine Thicket in the NSW North Coast and Sydney Basin Bioregions is eligible to be listed as an Endangered Ecological Community as, in the opinion of the Scientific Committee, it is facing a very high risk of extinction in New South Wales in the near future, as determined in accordance with the following criteria as prescribed by the *Threatened Species Conservation Regulation 2002*:

**Clause 26**

The ecological community's geographic distribution is estimated or inferred to be:

(b) highly restricted, and the nature of its distribution makes it likely that the action of a threatening process could cause it to decline or degrade in extent or ecological function over a time span appropriate to the life cycle and habitat characteristics of the ecological community's component species.

**Clause 27**

The ecological community has undergone, is observed, estimated, inferred or reasonably suspected to have undergone or is likely to undergo within a time span appropriate to the life cycle and habitat characteristics of its component species:

- (b) a large reduction in ecological function, as indicated by any of the following:
  - (d) change in community structure
  - (e) change in species composition
  - (f) disruption of ecological processes
  - (g) invasion and establishment of exotic species
  - (h) degradation of habitat
  - (i) fragmentation of habitat
